

## Green ‘Superbonus’: Our support to the Italian plan to relaunch the real estate and construction sectors

**Brussels, 26 May 2020 – We European real estate and construction associations welcome and support the green *Superbonus* proposed by the Italian government to relaunch the building sector.**

The COVID-19 pandemic has deeply disrupted the EU economy, the life of European citizens and business actors. The EU real estate and construction sectors have not been spared from those challenges. Urgent and unprecedented actions are necessary to promote ambitious measures for a revival of the building sector. At EU and national levels, the focus is put on Green Recovery.

In this context, the Italian *Superbonus* – a 110% tax discount on the expenditure for energy and anti-seismic renovation which merges two existing tools that have proven their efficacy after the 2008 economic crisis, namely the *Ecobonus* and the *Sismabonus* – has been announced. Households will be able to make use of the *Superbonus* to deduct renovation work on main residences and condominiums billed from July 1, 2020 to December 31, 2021. The tax advantage will be 110% of the costs incurred to be spread over five years, without income requirements. The credit can be used directly by the beneficiary, or it can be transferred to the supplier (e.g. contractor) carrying out the intervention, that can decide to discount it on its fiscal duties or transfer it to banks and/or financial intermediaries.

All the works already planned for the *Ecobonus* and the *Sismabonus* should be covered by the incentive, with the addition of two important sets of measures: photovoltaic and the purchase of batteries and charging stations for electric cars. The 110% *Superbonus* will also facilitate work on common parts of multi-apartment buildings.

Our associations fully support the scheme hoping that in Parliament the measure will be improved to scale up its benefits and effectiveness. This would notably require including rented properties<sup>1</sup> in the scheme, simplifying the conditions to pass on the credit to renovation companies or extending its timeframe of the scheme to factor in the long decision-making process in condominiums and postponement in permit procedure. With about EUR 7 billion investment until 2023 it should promote sustainable growth, improve energy efficiency and reduce CO2 emissions. Despite the large initial public investment required, the cost of the scheme should be compensated by increased tax revenue from business and job creation.

For all these reasons, we consider the *Superbonus* can set an example in Europe as a useful tool to foster a green recovery in the building and construction sector by setting incentives for households and companies. In the context of the Green Deal, member states should foster tax incentives considered by our sector as one of the most successful ways to encourage renovation decisions.

---

<sup>1</sup> The *Superbonus* can be used for rental properties only for the seismic part, not the part linked to energetic renovation, which will limit the impact of the scheme and complexify its implementation.
